

Crown Seat –Post Operative Instructions

Your new crown is now fit for chewing after approximately 30 minutes.

Please brush and floss the new crown as with your other teeth. You can still get decay under a crown if proper oral hygiene is not performed.

The crown can be sensitive to temperatures for 3-5 days or more. Please let us know if sensitivity persists beyond a few weeks.

If you should notice the bite being a little off or high when chewing, please call our office to have this corrected with a simple bite adjustment.
